

Galcon is proud to control the irrigation of the great vertical crop wall and the first of its kind at the Israeli pavilion at the universal exposition.

The crop wall measures to 62 x 12 meter featuring basic crops, including rice, corn and wheat, irrigated by Galcon's GSI system that was awarded product of the year 2013 by the European Irrigation Association (the EIA).

The GSI is a part of a full line of smart controllers, **Galcon Smart™**

A revolutionary concept brings the Internet of Things to the irrigation world, enabling you to monitor and control every aspect of your water usage from anywhere you are in the world – at any time.

Complete control is in the palm of your hand as you manage your system using your I-Phone, Android, laptop or any smart device with a variety of communications protocols, including radio, cellular, Wi-Fi and Bluetooth.
